PATENT NO. 6280953
GENERAL INFORMATION:
APPLICANT: MESSIER, WALTER
APPLICANT: SIRELA, JAMES M
CTITLE OF INVENTION: METHODS TO IDENTIFY POLYNUCLEOTIDE AND POLYPEPTIDE
TITLE OF INVENTION: SOUTHOUS WHICH MAY BE ASSOCIATED WITH PHYSIOLOGICAL
TITLE OF INVENTION: AND MEDICAL CONDITIONS
                                                                                                                                                                                                                                                                                                                                       RESULT 9

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AND BRAIN. LOW IN LIVER.

MISCELLANBOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENGYME ITSELF, AND FURTHER ADP-RIBOSYL GROUP ON A FIRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.

SIMILARITY: BELONGS TO THE PARP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: POLY(ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT TUMOR TRANSFORMATION AND ALSO IN THE REGULATION, PROLIFERATION, AND EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

CATALYTIC ACTYVITY: NAD(+) + (ADP-D-RIBOSYL)[N]-ACCEPTOR = NICOTINAMIDE + (ADP-D-RIBOSYL)[N]-ACCEPTOR.

COPACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

SUBCELLULAR LOCATION: NUCLEAR.

TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN OVARY, COCYTES,
                                                                                                                                                                                                                                                                                                                                                                                        l Similarity
